Centrex Contact & Deal Management

Curated CRM reference - grounded in the supplied transcript

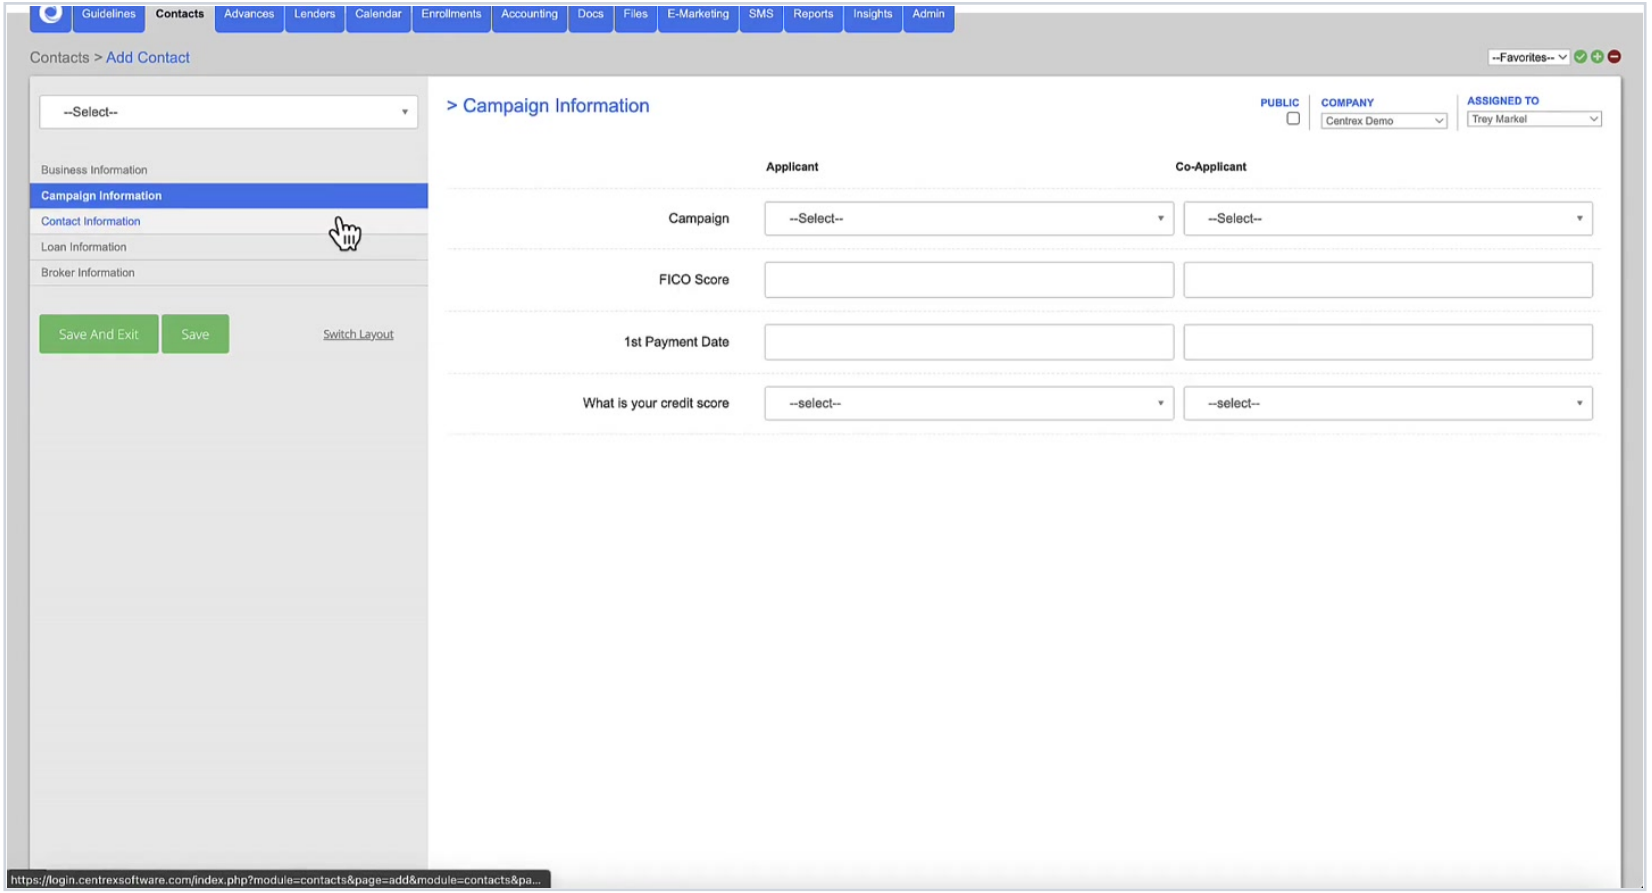

Repetitive screenshots have been removed. This version keeps only screens that introduce a distinct workflow or product concept. Each page explains what Centrex is demonstrating and whether/how that idea should be adapted into the trade-finance CRM.

Core adaptation:

- Centrex Contact -> Company + Person
- Centrex Deal -> Trade Transaction / Funding Request
- Centrex Client History -> Company + Transaction audit timeline
- Centrex Underwriting Conditions -> Explainable trade verification and underwriting checks

1. Add Contact / Structured Intake

Approx. video time 01:35 | Transcript 00:42-06:31

What Centrex is demonstrating

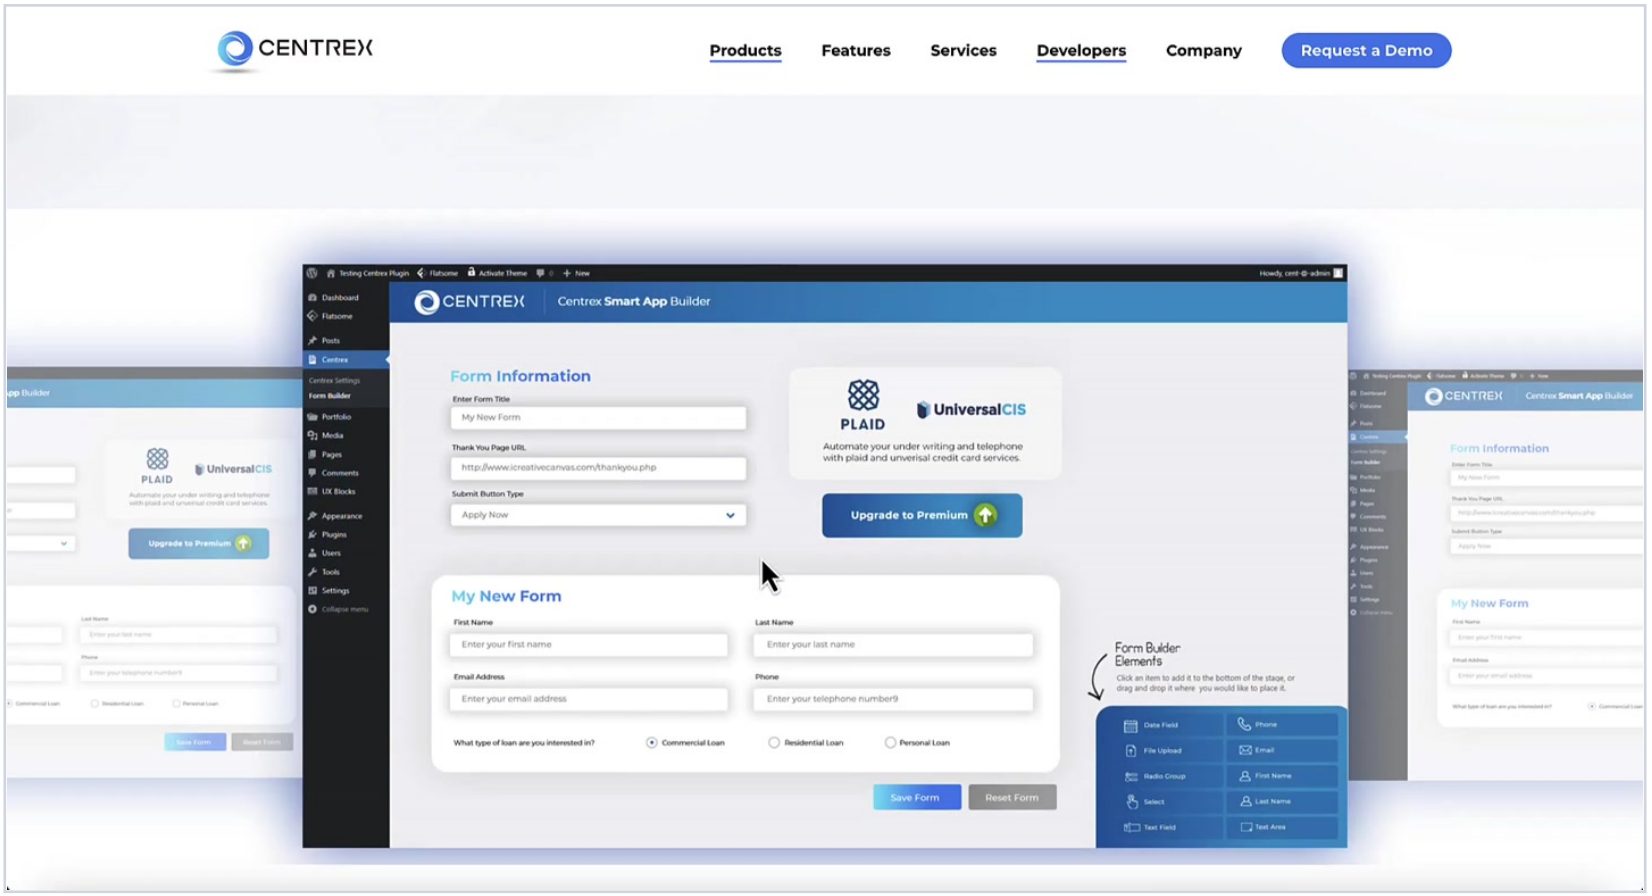

Centrex starts from a contact record. The transcript explains that the fields shown here are built from the customer's own documents, so the intake form can be customized to match the exact data points the business needs. It also supports multiple intake forms for different products.

What to add to our trade-finance CRM

- Keep the same idea, but separate Company and Person instead of treating everything as one Contact.
- Exporter/Buyer company intake should capture KYB, registration, financial, banking and trade-profile fields.
- Allow product-specific intake forms for exporter onboarding, buyer onboarding and transaction funding.

2. External Application / Website Form

Approx. video time 02:35 | Transcript 00:42-06:31

What Centrex is demonstrating

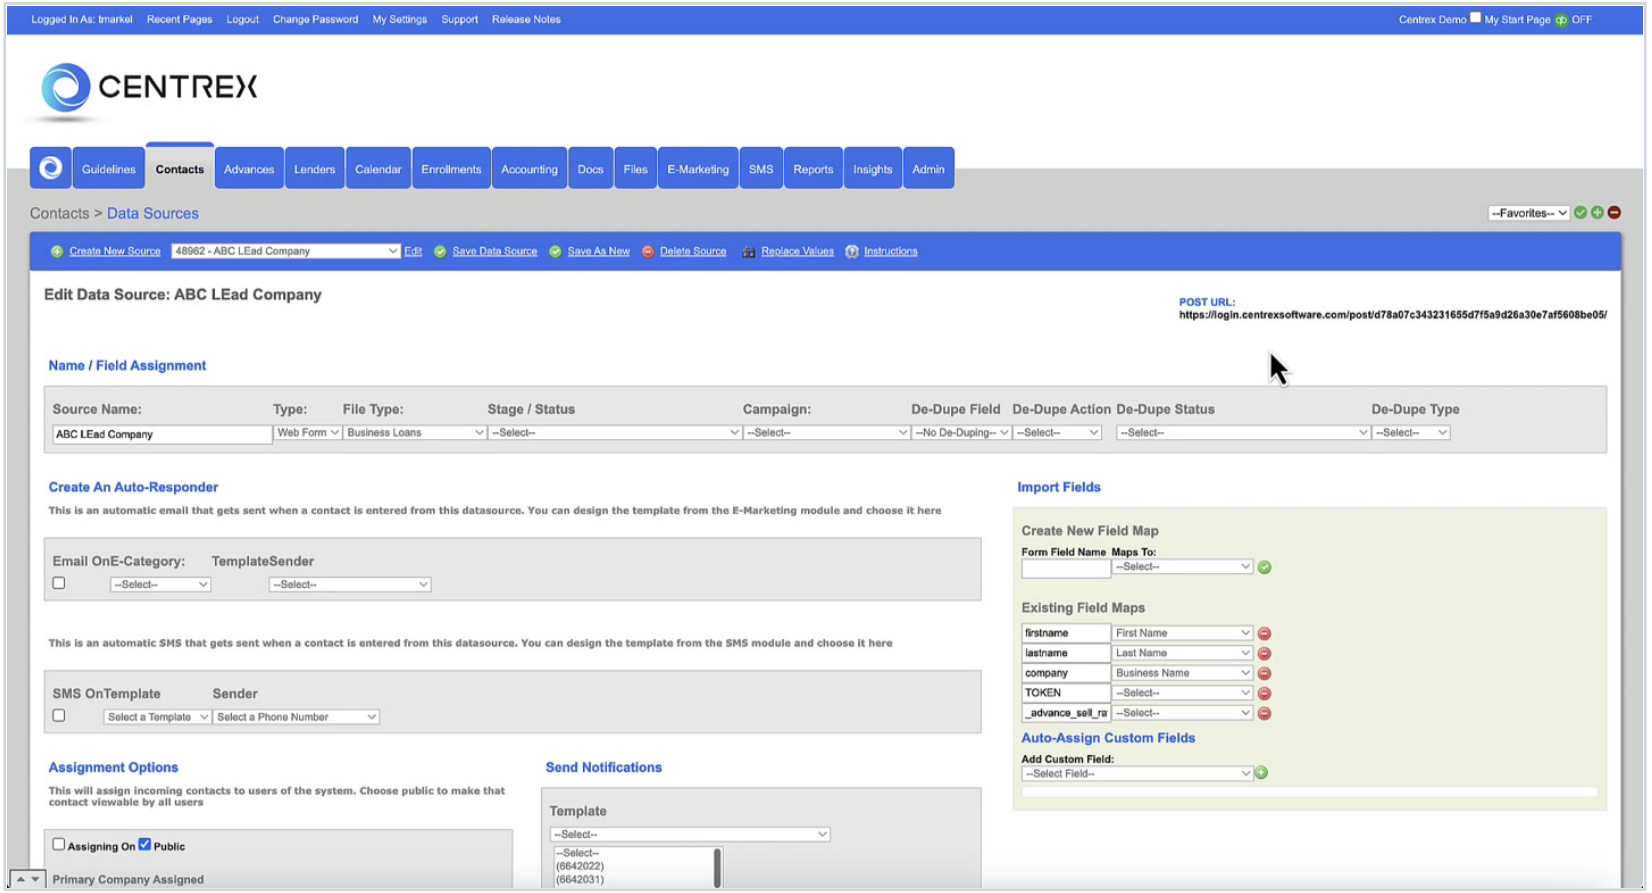

Centrex can collect data outside the CRM through website forms. The transcript describes multi-step forms, document upload and bank-account connection through Plaid, with partially completed applications still sending captured data back into Centrex.

What to add to our trade-finance CRM

- Add secure exporter and buyer intake links instead of forcing all data entry through internal staff.
- Support document upload from the external form: incorporation docs, PO, invoice, bank proof and trade documents.
- Save partial progress so an exporter can continue an application without losing already captured data.

3. Data Sources, Field Mapping and Webhooks

Approx. video time 03:05 | Transcript 00:42-06:31

What Centrex is demonstrating

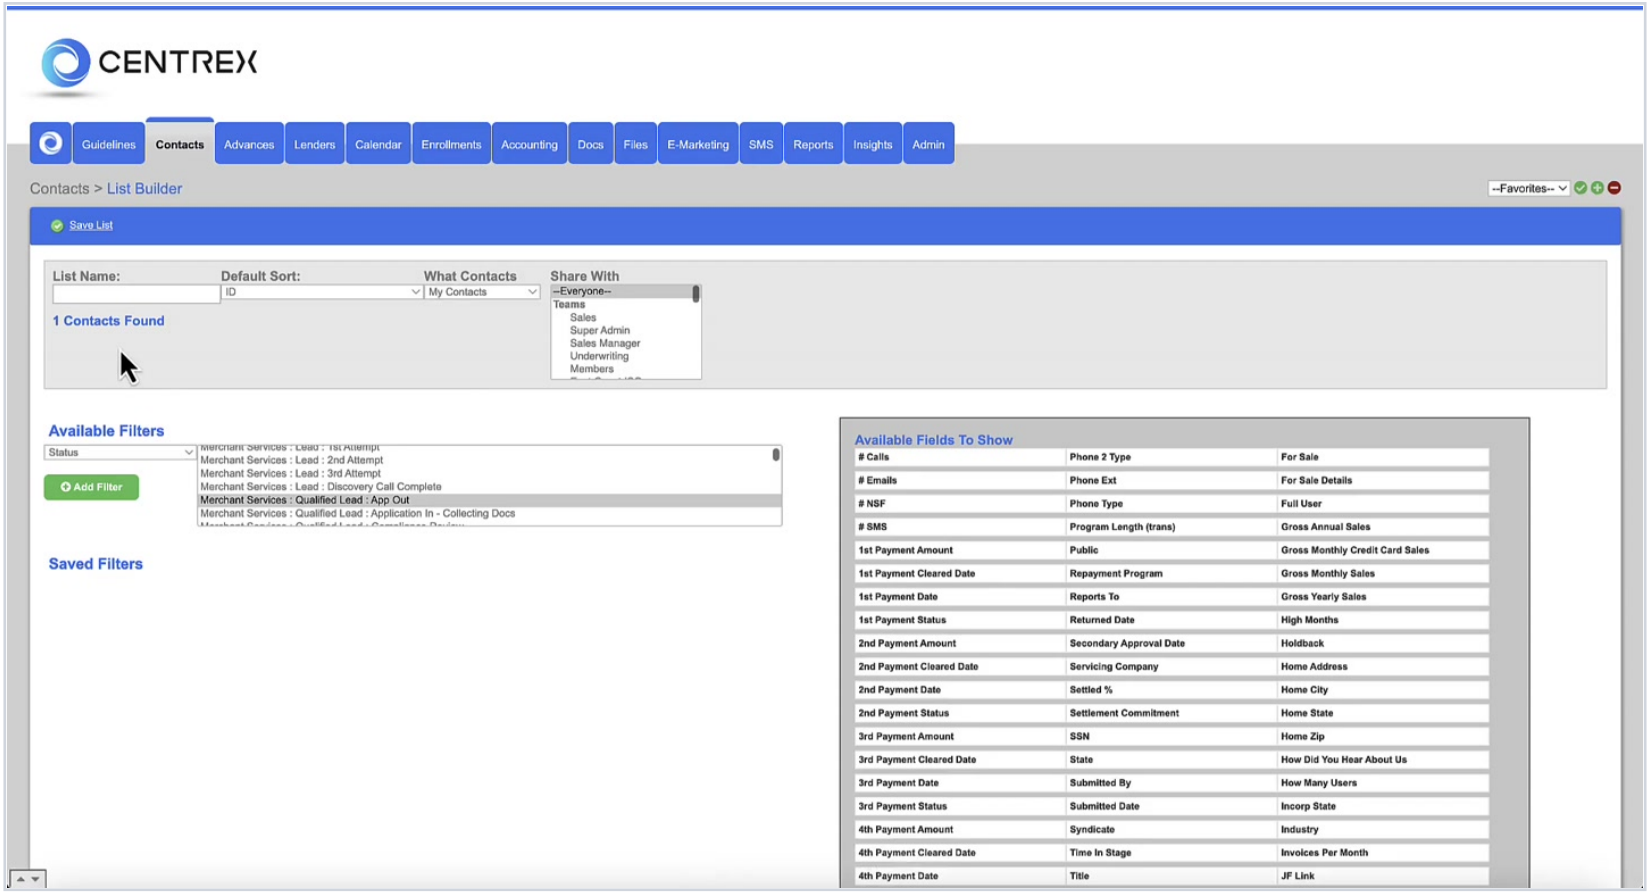

This screen is the ingestion layer. Centrex gives each web-form data source a unique POST URL, maps incoming fields into CRM fields, can send automatic email/SMS responses, assign incoming records, and trigger webhooks to external systems. The transcript also says CSV files can be imported and their columns mapped into CRM fields.

What to add to our trade-finance CRM

- This is highly relevant: model every source - RXIL, manual upload, API vendor, CSV import - as a named Data Source.
- Create a mapping layer so external provider fields map into your canonical Company, Person and Transaction schema.
- Use event/webhook hooks for KYB, AML, sanctions, financial-data, OCR and underwriting services.
- Add source-level de-duplication rules before creating a new company or transaction.

4. Dynamic List Builder / Work Queues

Approx. video time 05:35 | Transcript 00:42-06:54

What Centrex is demonstrating

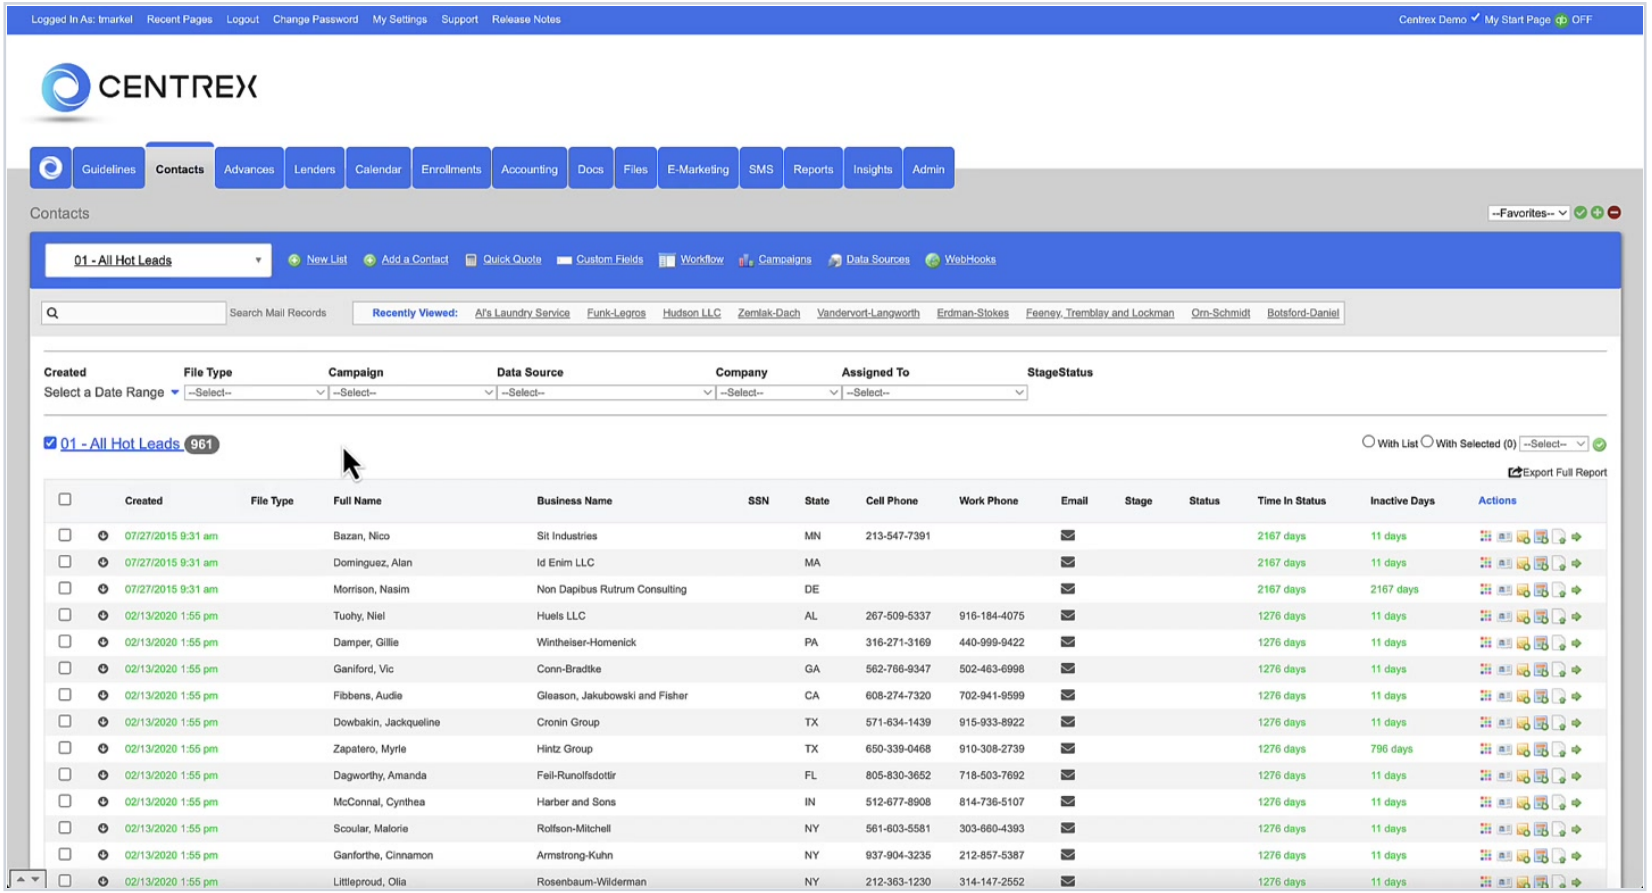

Centrex lets users build lists from filters such as status and share those lists with teams or users. The transcript emphasizes that records automatically move on and off lists when their status changes, so the lists function as live departmental work queues rather than static reports.

What to add to our trade-finance CRM

- Definitely copy this pattern.
- Create queues such as KYB Pending, Buyer Confirmation Pending, Underwriting Review, Documents Missing, Ready to Fund, Shipment Due and Payment Due.
- Apply role-based visibility so analysts see their own queue while managers can see team queues.

5. Contact List / Operational Workbench

Approx. video time 06:35 | Transcript 06:55-12:44

What Centrex is demonstrating

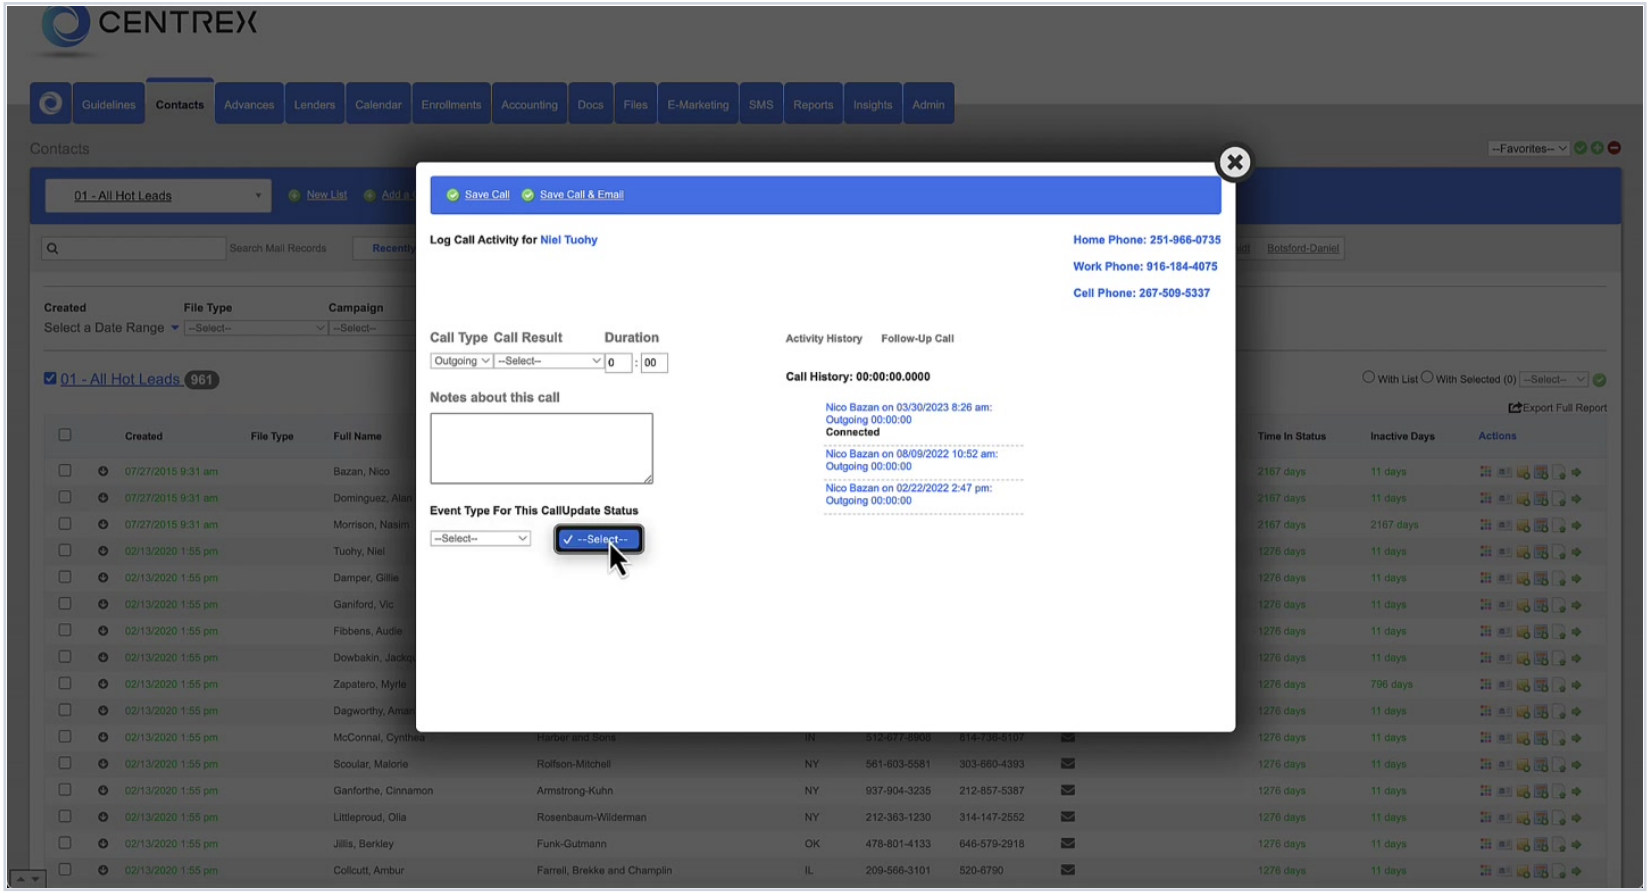

This is the main working list. Users can search, use recently viewed records, apply quick filters and perform row-level actions without opening the full contact dashboard. The transcript later adds bulk operations: selected records or the entire list can be mass edited, exported or sent through a webhook.

What to add to our trade-finance CRM

- Use this as the daily operations screen, but make the primary rows Companies or Transactions depending on the queue.
- Expose key risk/status fields directly in the grid so users do not need to open every record.
- Add controlled bulk assignment/status updates; avoid unrestricted bulk mutation for sensitive underwriting fields.

6. Call Tracking and Follow-up

Approx. video time 07:05 | Transcript 06:55-09:13

What Centrex is demonstrating

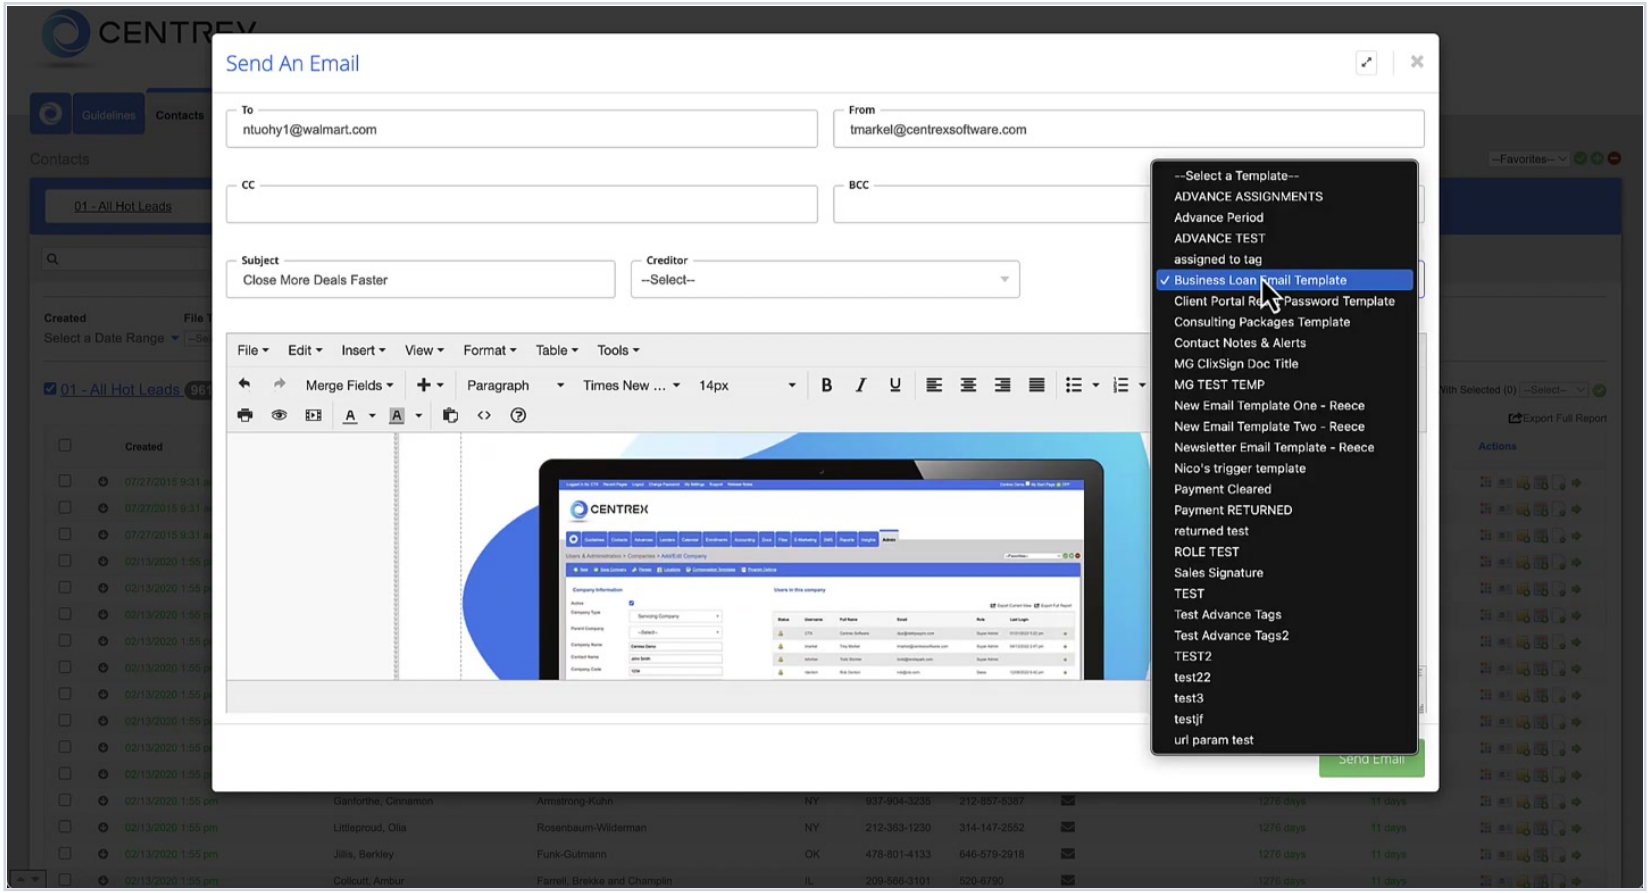

Clicking a phone number opens a call-tracking modal. The user can record whether the call was incoming/outgoing, the result, duration and notes, change status, and schedule a follow-up call. The transcript also mentions click-to-dial when an integrated phone system is connected.

What to add to our trade-finance CRM

- Useful for buyer/exporter verification calls and auditability.
- Log call purpose and outcome against the Company or Transaction.
- For buyer acknowledgement, record who was contacted, when, what was confirmed and the next action.

7. Email from the CRM

Approx. video time 08:05 | Transcript 07:23-09:13

What Centrex is demonstrating

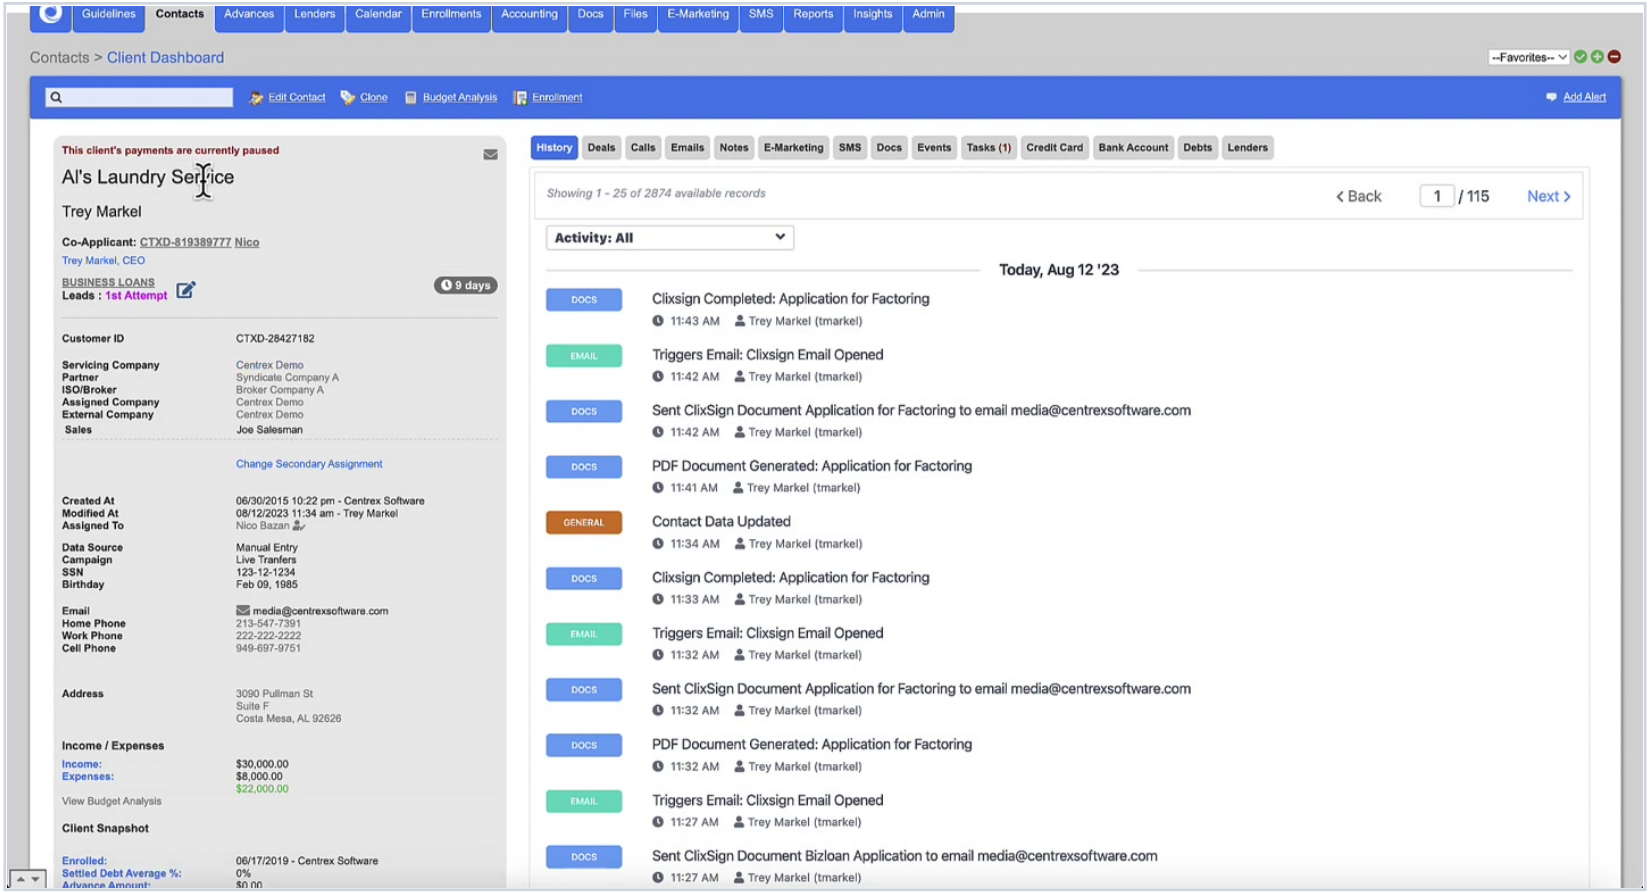

Centrex lets staff send email directly from the record, including CC/BCC, templates, signatures and attachments. The transcript says these messages remain part of the client interaction trail.

What to add to our trade-finance CRM

- Add templated emails for buyer acknowledgement, missing-document requests and funding/transaction updates.
- Associate every outbound email with the relevant Company and Transaction.
- Track delivery/open events only where legally and operationally appropriate.

8. Client Dashboard / Complete Audit History

Approx. video time 10:35 | Transcript 09:13-14:04

What Centrex is demonstrating

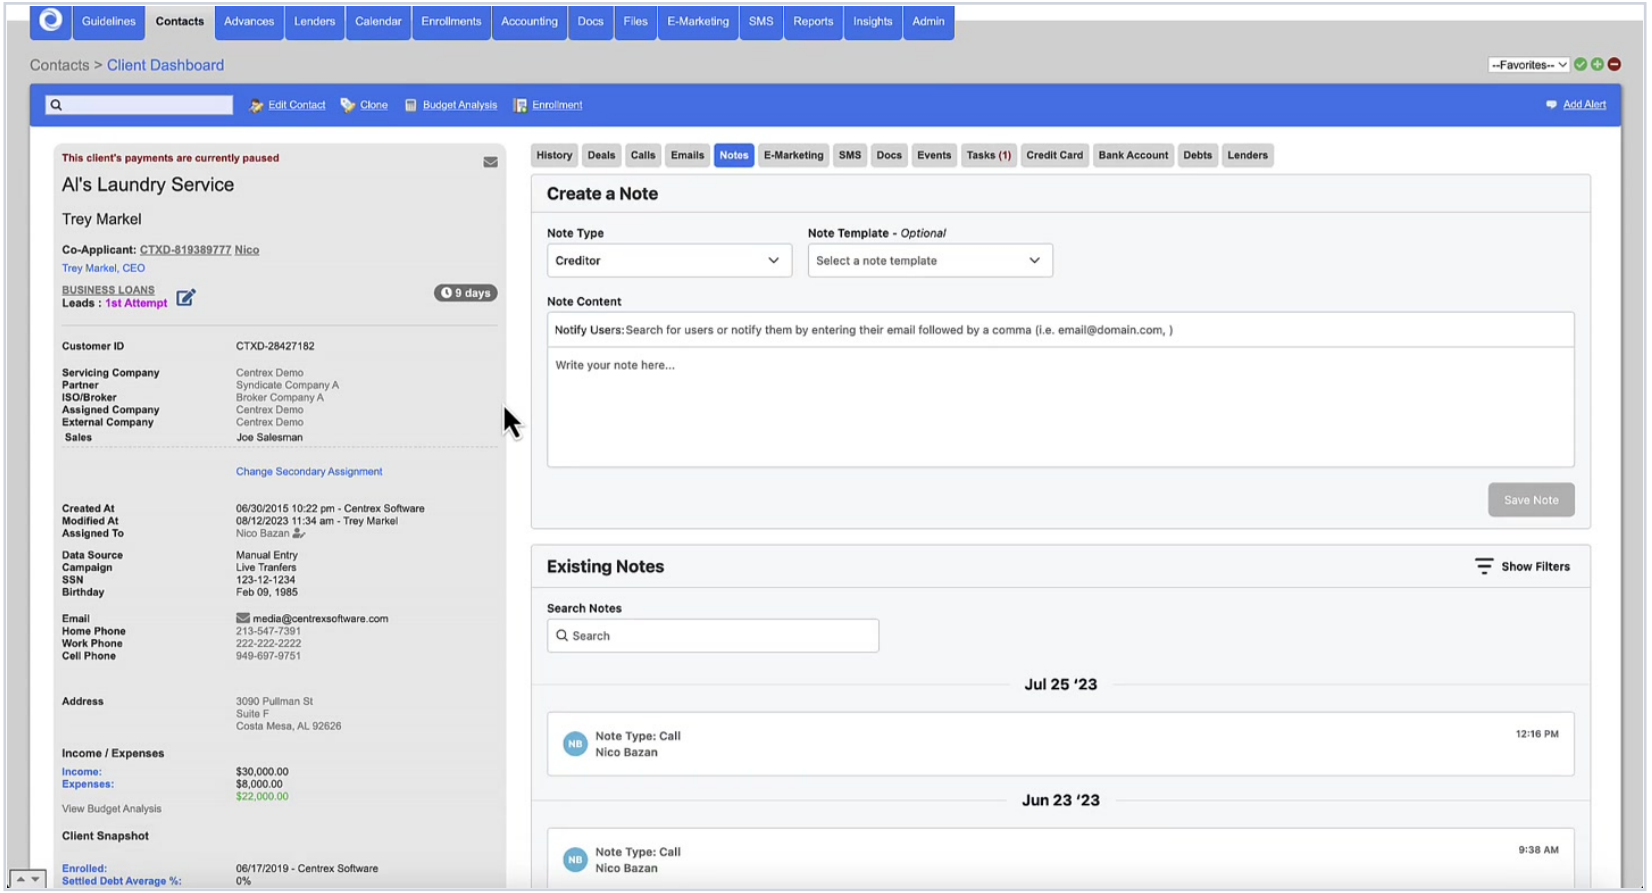

The contact dashboard keeps standard client information and assignments on the left and an activity history on the right. The transcript says Centrex tracks changes and interactions so there is proof of what happened with the contact, including stage/status history, assignments, emails, calls and document activity.

What to add to our trade-finance CRM

- This should become your Company 360 page.
- Keep a permanent event timeline: KYB run, AML result, buyer confirmation, document upload, underwriting decision, funding, shipment and repayment.
- Store who performed each action, timestamp, provider/source and before/after status where relevant.
- This audit trail is more important than copying Centrex's visual styling.

9. Notes / Underwriter Commentary

Approx. video time 13:05 | Transcript 12:44-14:04

What Centrex is demonstrating

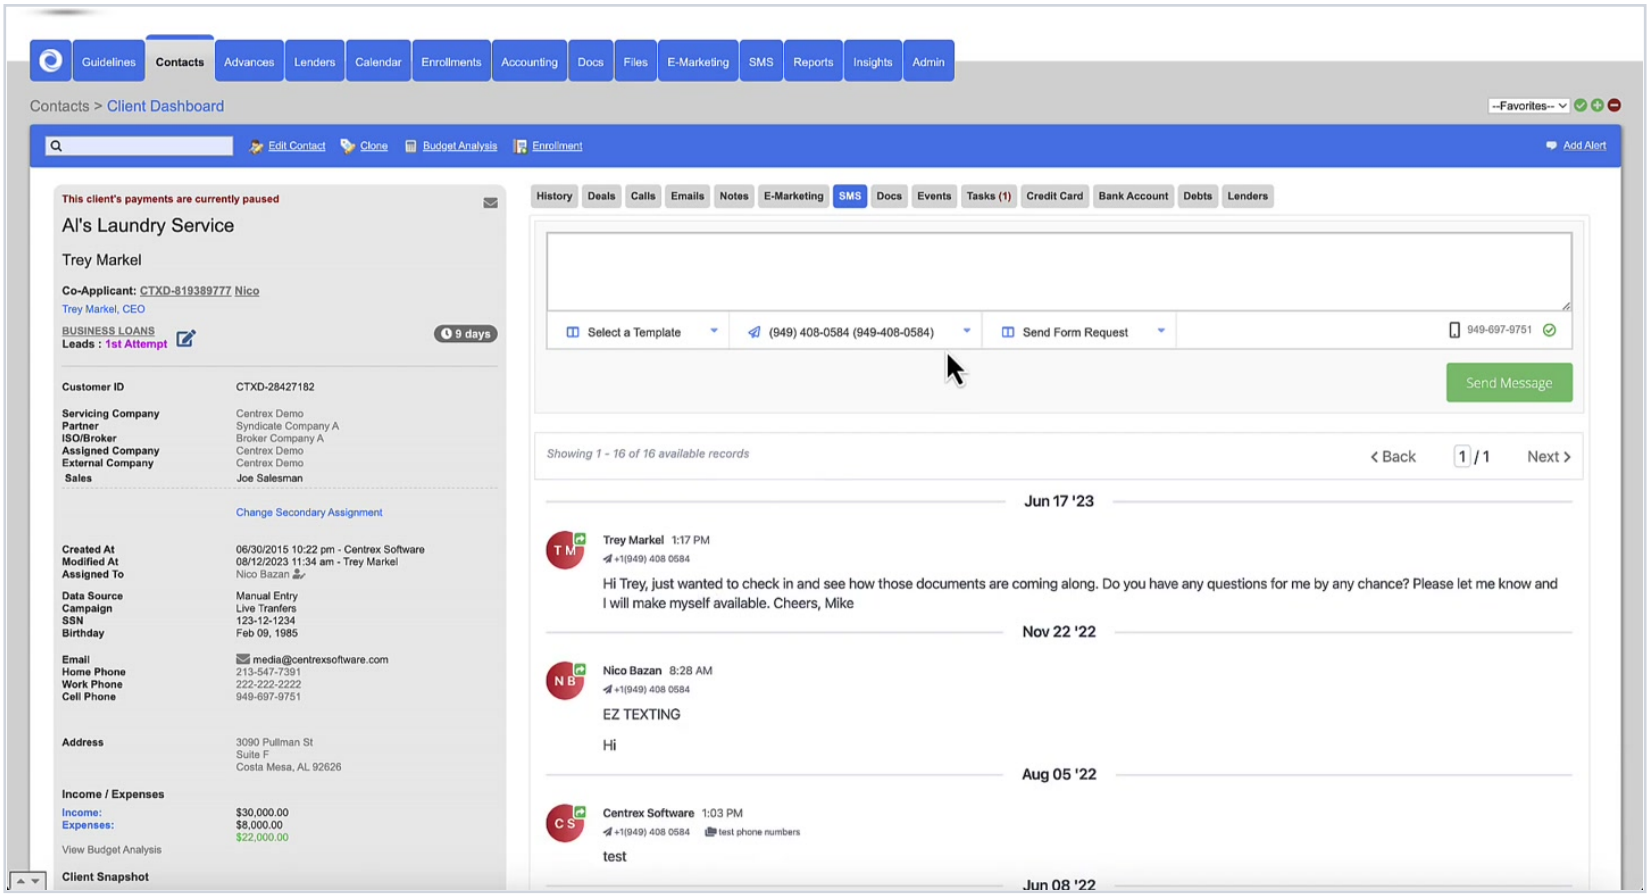

Notes are stored on the client record and can be categorized, created from templates, searched/filtered and used to notify other users. The transcript treats notes as part of the overall interaction and compliance trail.

What to add to our trade-finance CRM

- Add structured underwriting notes rather than one free-form text box.
- Suggested categories: Fraud Concern, Buyer Confirmation, Financial Review, Document Exception, Credit Decision and Follow-up.
- Require author + timestamp and preserve edited-note history for material underwriting comments.

10. Two-way Messaging

Approx. video time 13:35 | Transcript 12:44-14:04

What Centrex is demonstrating

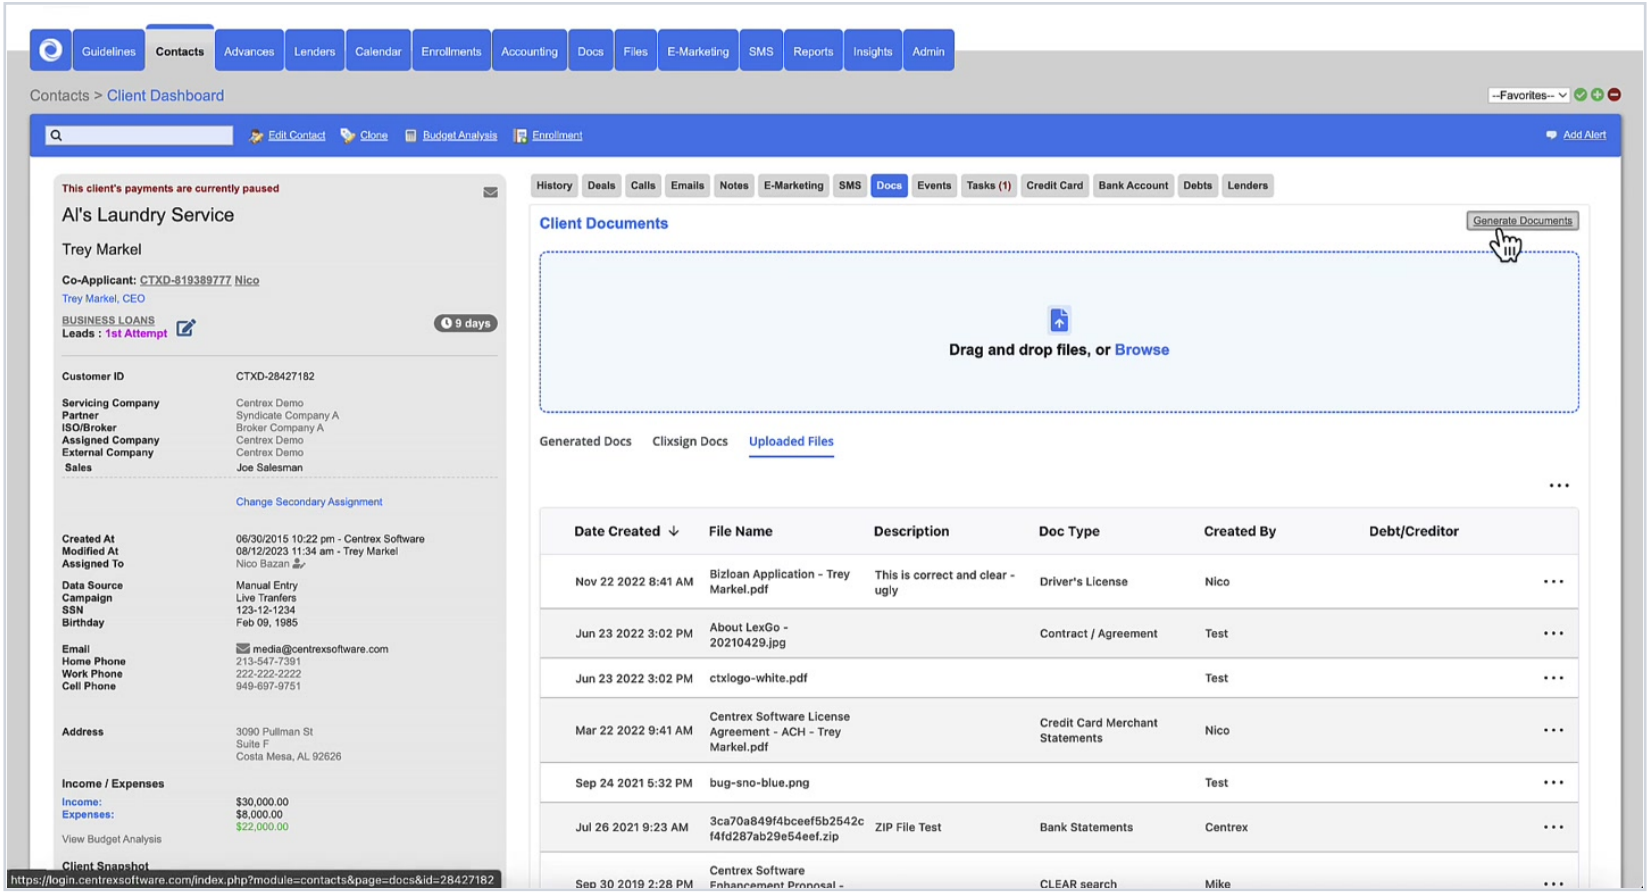

Centrex's SMS area keeps two-way communication inside the platform. The transcript says customer replies are captured back into the software through a Twilio integration.

What to add to our trade-finance CRM

- The channel is optional; the pattern is more important than SMS itself.
- For your product, use secure buyer/exporter links for acknowledgement and document requests, then retain the response in the transaction timeline.
- Do not make SMS a core dependency unless your operating process actually requires it.

11. Documents and E-sign

Approx. video time 14:05 | Transcript 12:44-15:45

What Centrex is demonstrating

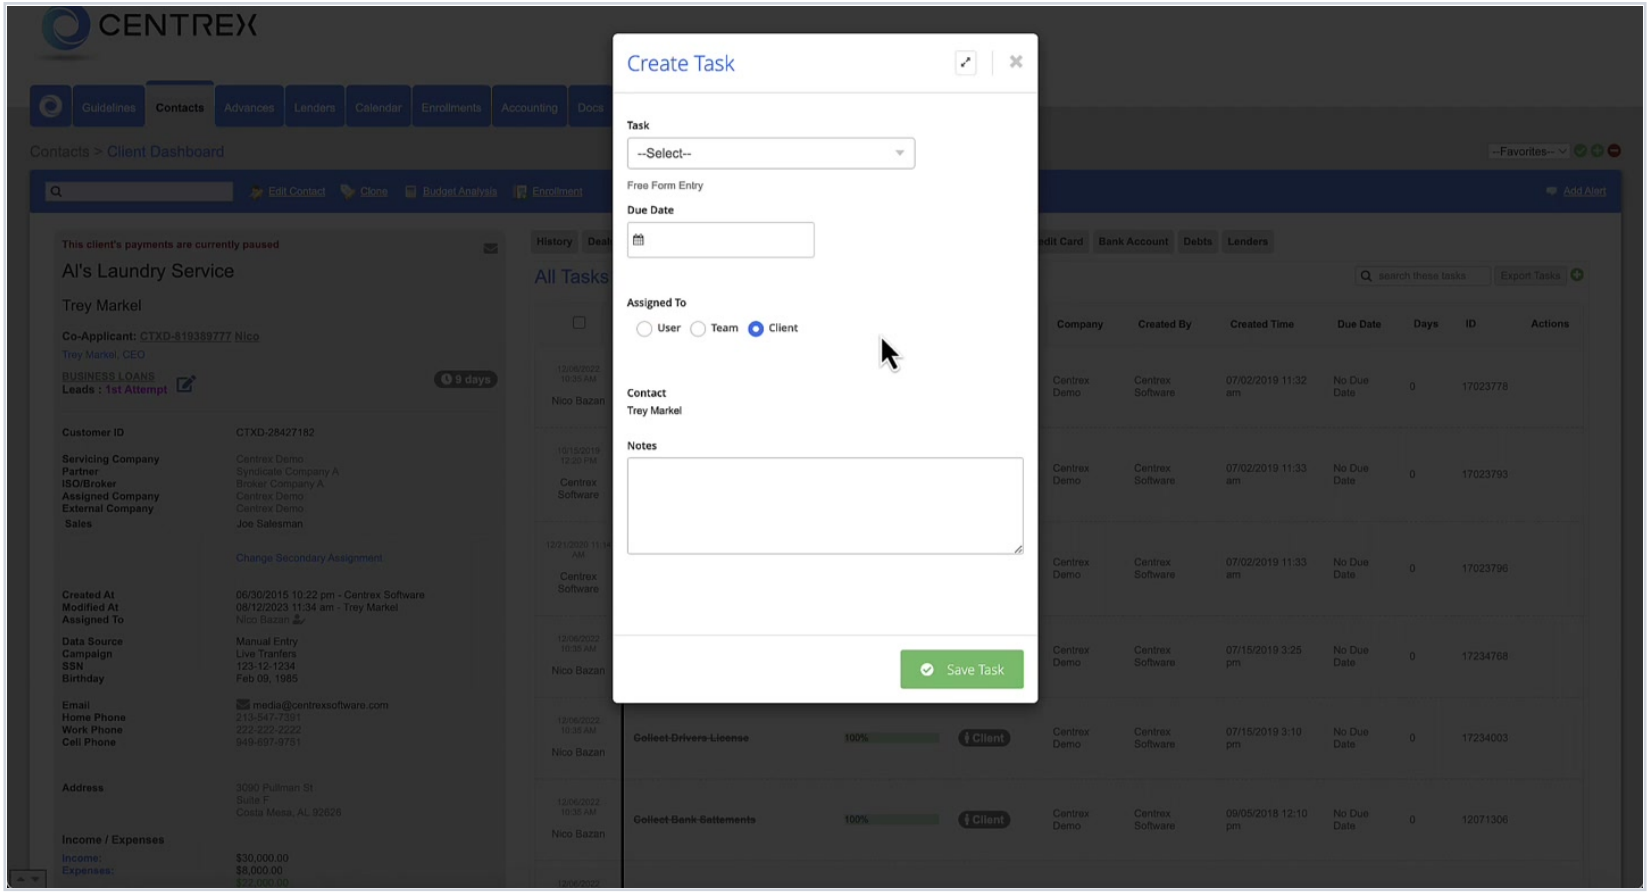

The Docs tab stores uploaded files, supports generated PDFs and can send documents for electronic signature. The transcript also says clients can upload files through the mobile app or client portal.

What to add to our trade-finance CRM

- This is core for your trade-finance product.
- Make documents transaction-aware: PO, invoice, packing list, shipping bill, bill of lading, CoO, insurance, inspection and buyer acknowledgement.
- Store document type, version, source, upload time, OCR/extraction status and verification status.
- Later add cross-document matching rather than treating the document store as passive storage.

12. Tasks / Operational Follow-up

Approx. video time 14:35 | Transcript 14:04-15:45

What Centrex is demonstrating

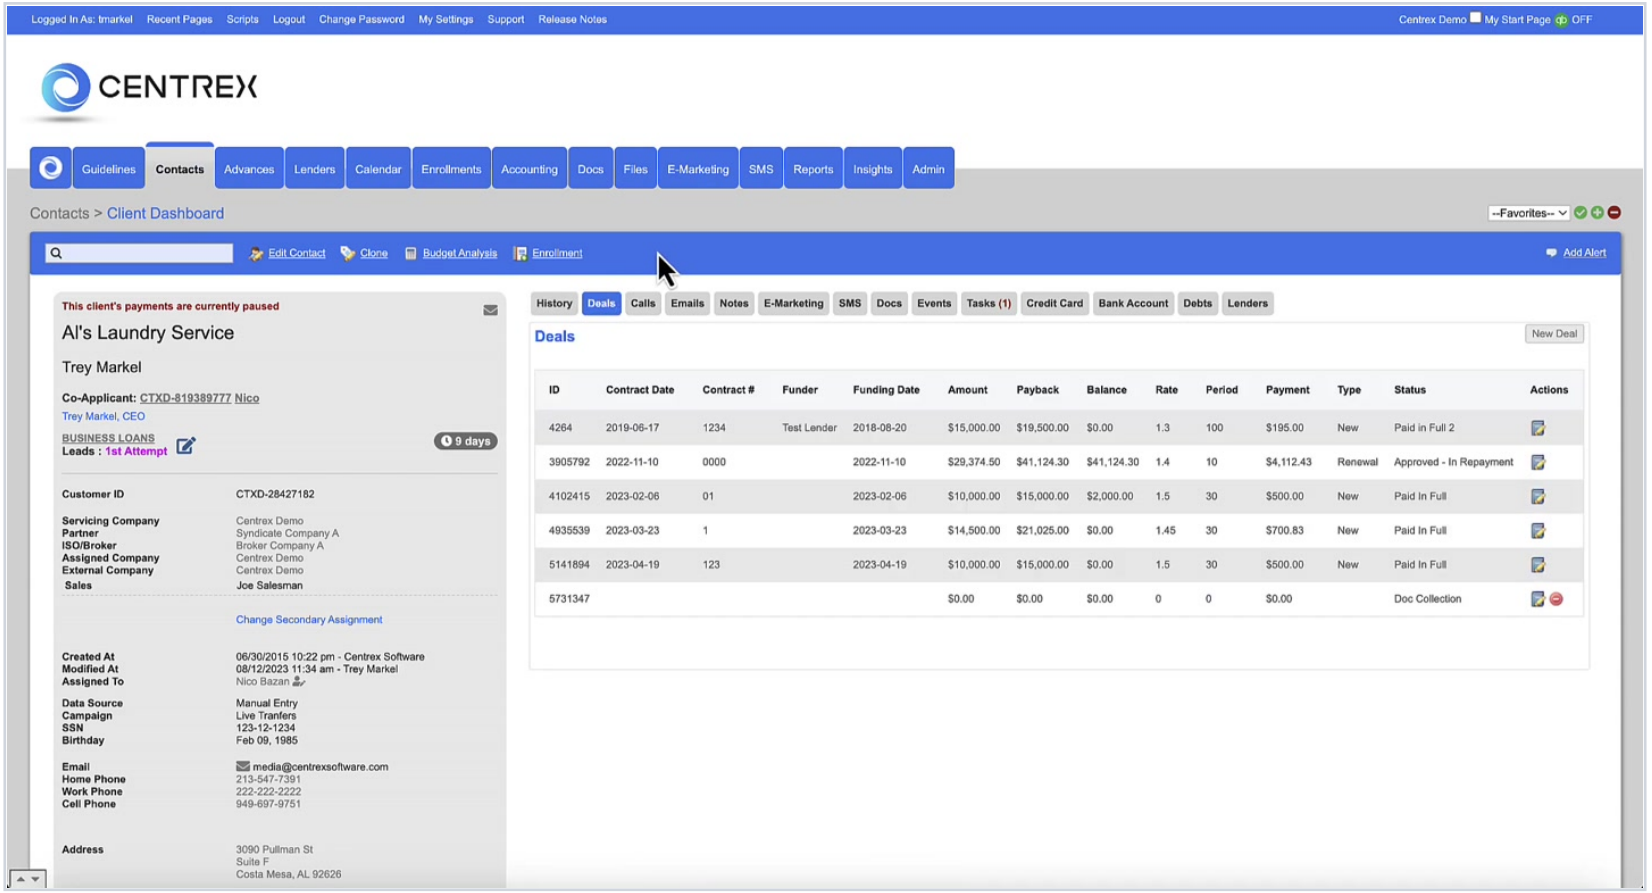

Centrex supports tasks assigned to users, teams or the client. Client-linked tasks can surface in the customer portal/mobile app, allowing the business to request that the client complete a specific action.

What to add to our trade-finance CRM

- Add task management, but drive tasks from the trade lifecycle rather than using generic reminders.
- Examples: Upload PO, Buyer confirmation due, Resolve KYB mismatch, Provide shipping bill, BL overdue, Payment follow-up.
- Allow system-generated tasks from rules and exceptions, not just manually created tasks.

13. Multiple Deals under One Client

Approx. video time 15:05 | Transcript 14:04-18:09

What Centrex is demonstrating

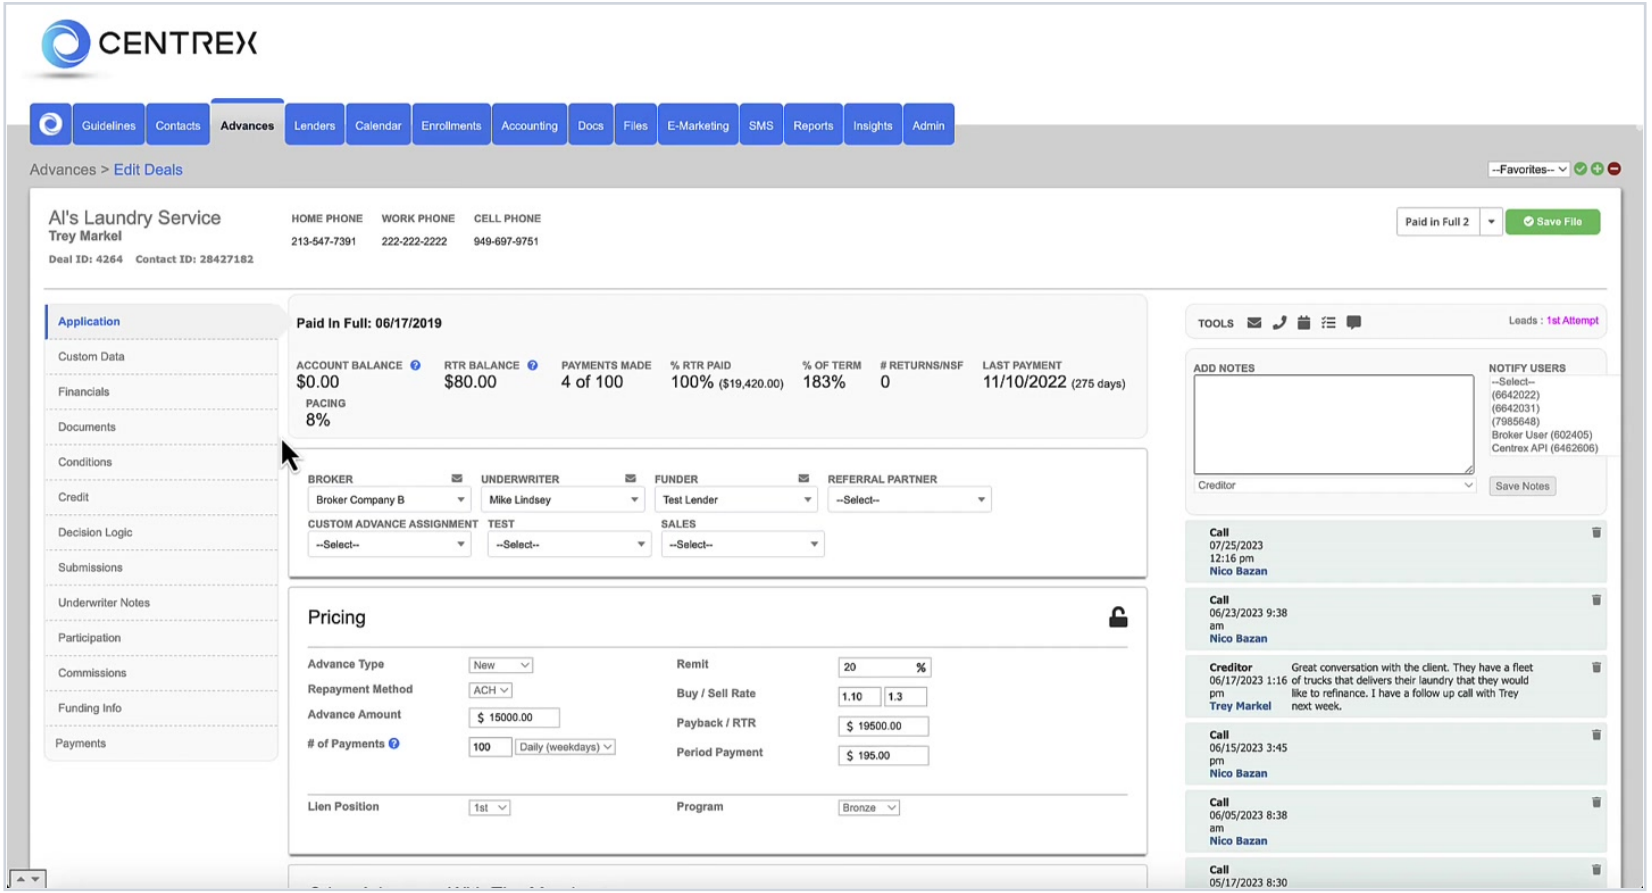

Centrex separates the long-lived client/contact from individual financing deals. The transcript explains that one borrower may have multiple loans/advances over time, and each appears as a separate deal under the same contact.

What to add to our trade-finance CRM

- This maps directly to your model: Company is persistent; each PO/invoice financing request is a separate Transaction.
- One exporter can have many transactions and many buyers; one buyer can appear across many exporter transactions.
- Do not store transaction-specific underwriting fields directly on the exporter master record.

14. Deal Detail / Financing Terms

Approx. video time 15:35 | Transcript 15:45-18:09

What Centrex is demonstrating

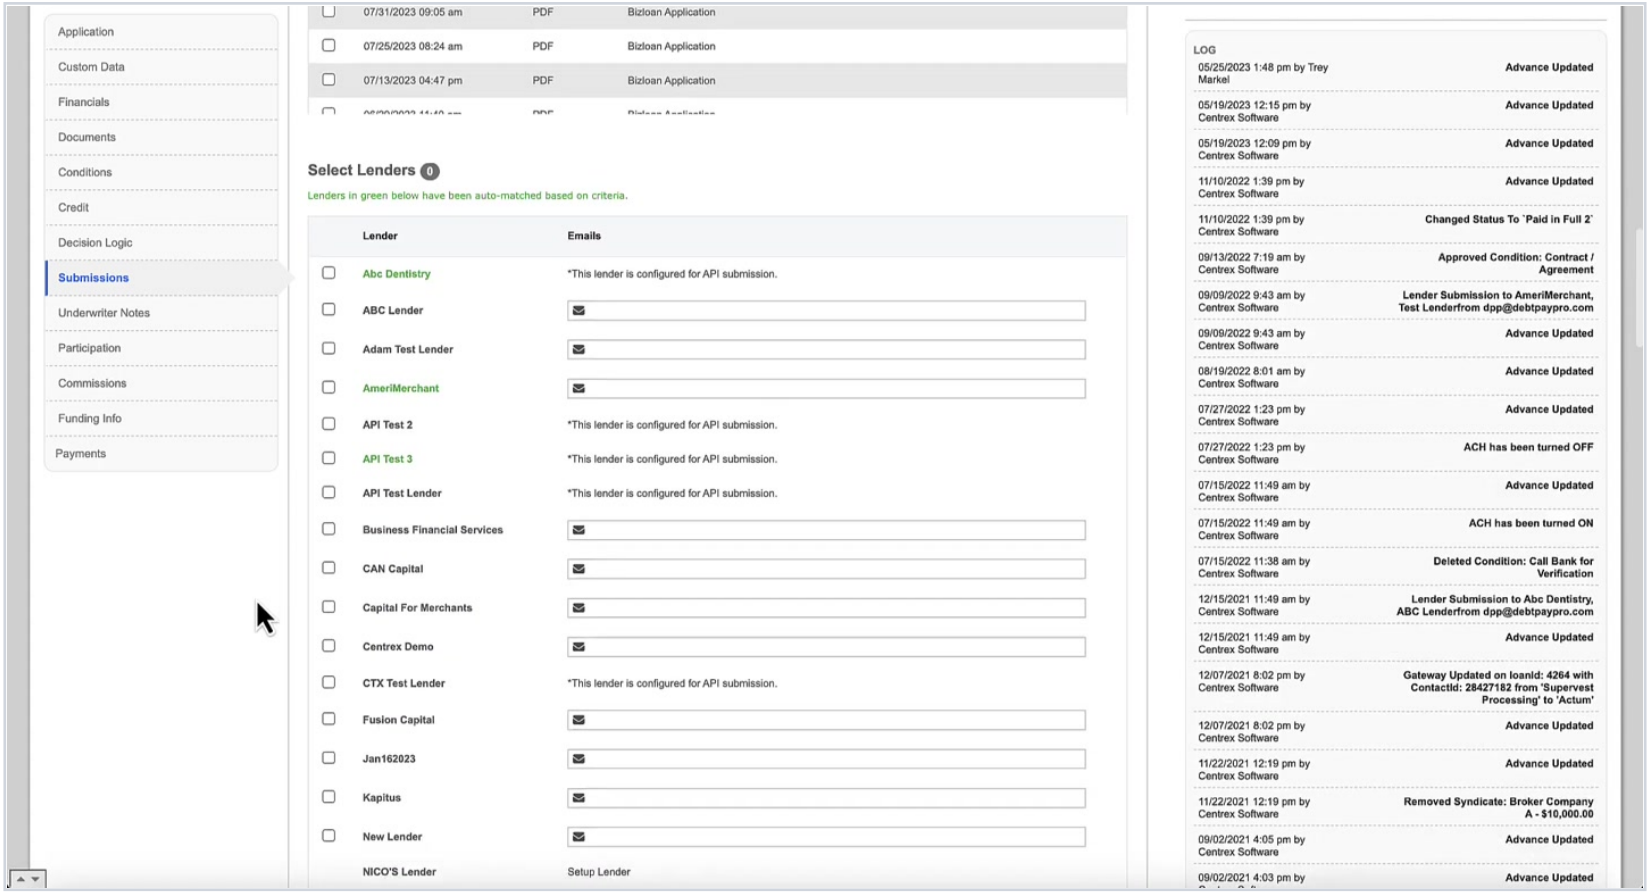

The deal page carries deal-level balances, assignments, pricing/calculation inputs and product-specific data. The transcript says deal assignments can include broker, underwriter and funder, while the deal contains the application, custom data, financials, documents, funding information and payments.

What to add to our trade-finance CRM

- Your equivalent should be the Transaction Detail page.
- Recommended sections: Overview, Parties, PO/Contract, Funding Request, Risk, Documents, Verification, Shipment, Insurance/LC, Timeline and Repayment.
- Assign a transaction owner, underwriter and financier separately from company ownership.

15. Underwriting Conditions, Decision Logic and Financier Submission

Approx. video time 16:35 | Transcript 15:45-18:09

What Centrex is demonstrating

Centrex's deal workspace includes underwriting conditions, credit, decision logic and lender submissions. The transcript says conditions can be approved/declined, credit and decision reports can be pulled, and deals can be matched and submitted to multiple lenders, including API-based submission.

What to add to our trade-finance CRM

- This is a major feature to borrow.
- Create explicit underwriting conditions/checks with status: Pending, Passed, Failed, Waived, Needs Review.
- Examples: buyer acknowledged PO, KYB clear, sanctions clear, duplicate-financing check clear, value within policy, documents consistent.
- Keep decision logic explainable and record which rule/data caused a pass, warning or rejection.
- If you later support multiple financiers, add eligibility/matching and API submission as a separate layer.
